Arterial ischemia is defined as a reduction or cessation of blood flow in an organ or body part resulting from obstructions or constrictions in the arteries that supply blood to the organ or body part. It is a common medical condition, occurring most often in the coronary arteries, and is a leading cause of death in the United States and throughout the world. Prolonged arterial ischemia may cause myocardial infarction, tissue damage, or both. An arterial stenosis is a local or general reduction of a blood vessel diameter, and may be the result of a narrowing of the lumen diameter, or a thickening of the arterial walls. Arterial stenoses are classified as either obstructive or non-obstructive. As used herein, obstructive stenoses include those lesions causing a  $\geq 50\%$  reduction in lumen diameter. Non-obstructive stenoses have less than 50% reduction in lumen diameter, and such stenoses are often asymptomatic. An arterial thrombus is a blood clot in an artery. In some cases, blood clots in arteries may be resolved through the action of the body's natural fibrinolytic or thrombolytic processes. In other cases, body intervention may be required. For example, in the case of a patient presenting with acute myocardial infarction or unstable angina, the thrombus may be dislodged and removed in order to restore blood flow. Not all patients present with symptoms associated with arterial ischemia. It is estimated that between 3-5 million Americans have asymptomatic atherosclerotic disease that is prone to plaque rupture and subsequent thrombus formation, and the vast majority of such patients will experience at least one non-fatal myocardial infarction (MI) before their 70th birthday. Such patients may be identified and treated based on well-established risk factor profiles. Patients with more risk factors, such as a family history of cardiovascular disease, diabetes, high cholesterol, low levels of high-density lipoprotein (HDL), hypertension, smoking and/or multiple atherosclerotic risk factors, are more likely to suffer a cardiovascular event, including myocardial infarction, or stroke, often during mid-life, and as a result are at increased risk for subsequent acute cardiovascular events. While many acute cardiovascular events and myocardial infarctions are due to obstructive coronary atherosclerotic
