Q: Limit of $5g(x) = 2^x 5$ If I want to ask the limit of $5 \lim_{x \rightarrow \infty} (x \log_2(x))$, should I say that it is infinity or it doesn't have a limit? A: Take $5 \log_2(x)$ to get the answer. A: The limit is 505 , not infinity. The expression is positive, and is increasing, therefore its limit is its maximum value. That is, the limit is $52^n 5$ for every integer $5n$. Q: What is the proof that the maximum age of an infant at birth is 51205 days? Possible Duplicate: Why is the age of a human being at birth 120 days? In biology classrooms, we learn that infants are born at the age of around 120 days and some other terms. I often think how can there be a proof behind a statement. But I am not getting any convincing evidence regarding the proof behind the statement. What is the proof that an infant born at the age of 120 days is about to become one year old? A: Age is not a continuous variable, it's discrete (divisible by 7). If you divide by 7, 120 days is a convenient rounding for a year. Around the world, very young babies are fed at the breast until a little over a year of age, and by that time they are walking and eating solid foods, which require different physiological and neurological functions than feeding at the breast. A: This is more of an opinion that I have than any kind of scientific fact. This seems like a relatively age related concept to me, so I would reason that if you can reach 120 days of age (which is the same age as a year in this sense) then that would be the limit for a baby to successfully mature. In reality, it is much more complicated than that. A baby's brain is developing and changing all the time, plus it is constantly asking you to feed it. However, it still follows this basic general pattern of mind. A: Most people have some age-related knowledge about their own life, and about the lives of others, but most of it is vague and fleeting. As everyone else pointed out, babies develop from a point of few months to a year. A baby is still in

Q: Why do I have to give my own variable a value before I can refer to it using a command? I am trying to do something like this: `Clear[t][5] = 1 t[1] = 2 t[3] = 4 t // Times` How do I turn this into a list? `Clear[t][5] = 1 t[1] = 2 t[3] = 4 t // {t[5], t[1], t[3]}` I've searched for a while and the only solution I found was to use `Set`. But why does this work: `Set[t[5], 1, t[1], 2, t[3], 4]` and this doesn't: `t[5] = 1 t[1] = 2 t[3] = 4 t // {t[5], t[1], t[3]}` The reason for wanting to do this is that I want to do it for arbitrary combinations of variables, and not have to use an "evaluated expression" like `Set` does. A: You can use `Reflection`. `Clear[t][5] = 1; t[1] = 2; t[3] = 4; t /. {v_Symbol, a___, b___, c___} -> {v, a, b, c} [t[5], t[1], t[3]]` Alternatively, you can use `DownValues`. It also automatically uses `Mod`. `Clear[t] SetAttributes[myt, HoldFirst]; myt[5] = 1; myt[1] = 2; myt[3] = 4; t // myt [t[5], t[1], t[3]]` A: If you have to stick with `Times` (or `TimesList`) and you want to capture the inputs, I would consider using the option `UpValues`: `Clear[t][5] = 1 t[1] = 2 t[3] = 4 t[_] -> (t = #) & t // Times [t`
