AutoCAD goes beyond a pure-drafting software application to include many specialized design, engineering, and drawing-related tools, including engineering and drafting tools, math tools, project management tools, and 3D modeling tools. AutoCAD also supports numerous file types. Key Developments 2006: Autodesk acquires Avid, a supplier of media-based creation software, including the Avid Media Composer (now known as Sceneline) editing tool. 2007: AutoCAD 2008 releases, the first major release of the software since 2003. Other release highlights include a new Document Map, which supports editing 3D documents in 2D; a new User Interface and features; and improved engineering and drafting tools. 2008: Autodesk purchased CADsoft, a software company specializing in 3D CAD. The acquisition included Cimatron (which sold through Autodesk in 2013), CAMMIE (which sold through Autodesk in 2010), and HP Sveafor (a tool used in part-and-parcel calculations for land development in Sweden). 2009: AutoCAD 2010 releases, which include new engineering and drafting tools; a new Preset Manager; and a new cost and schedule tool. 2010: Autodesk acquired Precol, a provider of collaborative drawing applications. 2011: AutoCAD 2012 releases, which include tools that expand on those available in AutoCAD 2010. 2012: AutoCAD 2013 releases, which include tools that expand on those available in AutoCAD 2012. 2014: Autodesk bought Desktop Architect, a vendor of desktop 3D modeling software. 2015: Autodesk announced the acquisition of the American software company B-Cubed, a provider of feature-rich drafting and design software for industrial and mechanical design professionals. Acquisition Activity AutoCAD's long-term strategy is to build its business by acquiring complementary, similar, or related businesses and technologies. AutoCAD has acquired some businesses or technologies that have no direct connection to CAD software, such as Avid Systems' (now part of Avid Technology's) technology for media-based creation software, and Cimatron, CAMMIE, and HP Sveafor (a Swedish tool for land development calculations). However, even though the programming languages support AutoCAD's object oriented design and basic data structure such as arrays, a deeper understanding of the programming capabilities is required to make good use of the underlying tools. Using the LISP language as an example, AutoCAD LISP files can be created, processed, and evaluated using functions defined in the files. To start the year, he was rated the #5 second-line left wing prospect by NHL.com. Rau has posted 24 points (7G, 17A) in 29 games. His point totals are all even, with his 7 goals being evenly split with his 17 assists. With 16 penalty minutes, Rau is on the right

side of the plus/minus chart. Rau's strong play during the month of December has earned him a place on the team's fourth line. He continues to face tough competition in the AHL, but has earned the call-up. Rau has showed flashes of offensive production and he should receive the call-up and get some real NHL ice time in 2013-14. A number of clubs have expressed interest in the talented, 6'2″, 194-pound Rau. He could be on the move this summer and be a target of many teams. As of today, the top two choices are the Colorado Avalanche and the Minnesota Wild. The Colorado Avalanche are in need of left wing help and have the cap space to make a move. On the other hand, the Wild have struggled to generate offense and this move could help them turn their season around. Rau would be a much-needed addition for any team looking to add some scoring punch. Photo Credit: mil af5dca3d97

Snoek*†**]{}\ *Department of Electrical Engineering, †Department of Computer Science\ University of Leuven, Belgium title: 'A Family of Fixed-Point Networks for Large Scale Kernel-Based Classifier Systems' --- Conclusions =========== We have presented a new fixed-point network family suitable for large scale kernel-based classifier systems, and a novel family of kernels that can be used as they are or after transforming them to kernel matrices of a certain fixed-point network. The analysis of these two families is based on novel matrix inequality techniques which lead to much better complexity bounds than previously known for the class of columnwise-convex kernels. Two main challenges still need to be addressed, namely the determination of the sparsity level of the networks and the selection of the network parameters. In this paper we have presented only a first step towards this goal. We have not tried to optimize the sparsity of the networks nor to optimize the network parameters, and leave these issues for future research. [10]{} S. Arora, E. Liberty, and R. Mantiuk.
