Propecia is the brand name for finasteride, an ester-substituted derivative of 5-alpha-R-4-aza-steroid. Finasteride is an important drug in the treatment of benign prostatic hyperplasia (BPH) and androgenetic alopecia (AGA). It is also used to treat enlarged prostate glands caused by an overproduction of prostate secretion (prostatic hyperplasia). Propecia is used mainly in the treatment of BPH, and in alleviating symptoms of male pattern hair loss (androgenetic alopecia). Finasteride has been shown to be effective in numerous men with androgenetic alopecia. It reduces the growth of facial hair and is used to treat men with female pattern hair loss (androgenetic alopecia). It is also used to treat prostatic hyperplasia in men who have not responded to treatment with finasteride or other drugs used to treat prostatic hyperplasia, and as initial treatment for men who have symptoms of prostatic hyperplasia and are candidates for surgery. By blocking the effects of the male hormone DHT in the prostate (in an area called the prostate gland), finasteride can reduce the volume of the prostate. It can therefore treat symptoms of enlarged prostate. Because it reduces the amount of DHT, finasteride can also prevent hair loss in areas such as the scalp, face, etc. By reducing the size of the prostate gland 6d1f23a050
