Let T be the set of all subsets of \mathbb{R} that are Lebesgue measurable and contain no open intervals. If $X \subseteq \mathbb{R}$ and Y is the set of all $f: X \rightarrow \mathbb{R}$ that are continuous on X , such that $\{x: f(x) \in T\} \in T$ for all $x \in X$, then T is the exact topology on X . Is this true? A: Yes, that's true. In fact, one should probably include the condition that T is a T_1 topology in your first line, since a T_1 topology would only form a base for a T_1 topology. Then your question can be restated as follows: Let T be the set of all subsets of \mathbb{R} that are Lebesgue measurable and contain no open intervals, and let X be a set. Then T is a T_1 topology on X . Now, it is easy to see that a subspace that is T_1 in a T_1 topology is a T_1 topology by definition. The answer is therefore yes. Q: How to get : not appearing when output is in sliders? Possible Duplicate: CSS "not" selector not working when the element has a specific class When I run this:
