#2.99 This is the second version of the game. It also brings lots of new content, such as new. Icon and thumbnail for the game. -.1. Field of the Invention The present invention relates to a method of driving a light emitting device, and more particularly, to a method of driving an organic light emitting display device which can further enhance the durability of a pixel circuit unit and can prevent a leakage current, and an organic light emitting display device that can implement the method. 2. Description of the Related Art Recently, flat panel display (FPD) devices that are excellent

in their design, color expression, power consumption, and the like have been actively developed in the market. Such FPD devices can be largely classified into organic light emitting display devices (OLEDs), liquid crystal display devices (LCDs), and the like, depending on the emission type of a light source that is used in a display region of the FPD devices. Organic light emitting display devices are self-emission display devices in which a light emitting diode formed of an organic material is used as a light source. A light-emitting material of the organic light emitting display device is excited when electrons and holes are injected to an organic thin film

and are thus converted from an excited state to a ground state to emit light. An organic light emitting display device has several distinct advantages over other display devices, such as high brightness, excellent contrast, wide viewing angle, fast response, and so forth. Furthermore, the organic light emitting display device has higher light emitting efficiency than other types of flat panel display devices. Due to these advantages, the organic light emitting display device is widely researched and commercialized. In the case of an organic light emitting display device, as a self-emitting type display device, a plurality of pixels are disposed in a

matrix form. Each pixel includes an organic light emitting element that is capable of emitting light with a luminance according to a data signal, and a drive transistor that drives the organic light emitting element. However, the organic light emitting element is very sensitive to external impacts. In other words, when an external force is applied to a conventional organic light emitting display device, the applied external force can be directly applied to the drive transistor of each pixel and thus cause a leakage current. Determination of radiographic artifacts in CT examinations using a deformable

phantom. To develop and assess a deformable three-dimensional (3D) phantom that can be used for the determination of c6a93da74d
